GEEKSYNERGY TECHNOLOGIES PRIVATE LIMITED

Backend Developer Coding Exercise

1. Create a web application and connect with mongoDB
2. Create a user registration page using bootstrap. Users field will be Name, Password, Email, Phone No, Profession. **Note:** Password should be save in encrypted format.
3. Send the user registration data to server by calling API. And show notification after getting response back from server.
4. Create login page and validate email and password, once user verified, then take them to home page.
5. In homepage, Create a API to list all registered users in a JSON structure.
6. Create an API to update registered user data like name, phone number after selecting record from above structure.
7. Same way, create an API to delete registered user record.
